

General Improvements:

- a. Use of just one axios instance with a base url.
- b. Use of axios interceptors to handle loading.
- c. Use of better font family for main headings (like bebas neue)
- d. Buttons can be better in design (like providing them a gradient or maybe more border radius)
- e. For options we can provide an array and after that loop over it using map property.
(Will decrease code length and increase readability.)
- f. Prevent importing of modules not in use.
- g. Separate files for axios requests.
- h. Signin and signup can be combined to just one component only. (Right now they have different components)

1) index.tsx:

Importing dependencies not in use. (May contribute to increase bundle size)

```
import { connect } from 'react-redux';
import Layout from '@components/layouts/Layout';
import AddCount from "@components/AddCount";
import Navbar from "@components/layouts/Navbar";
import HomeScreen from "../HomeScreen";
import AllArtists from "../allartists"
import '@assets/styles/styles.scss';

const Index = () => {

  return (

    <Layout>
      <HomeScreen/>
    </Layout>);
}

export default connect()(Index)
```

2) homescreen.tsx:

code too big for one file, can be divided into components (increase readability of code!).

importing dependencies not in use.

Creation of a separate folder for static data (ex for static arrays and svgs.)

Separate file for helper functions.

Styling:

- a. buttons looks really simple (maybe adding some gradient)
- b. In about us section 3 cards really look dull (I think some opacity has been added)
- c. In some parts the text is not visible clearly.
- d. Normal para text looks too big.
- e. In how it works, the left section (containing video) looks empty.

3) Contactus.tsx:

For phone, email, address section- the p, h2 tags repeated. (We can just put them inside an array and after that apply map property of array).

Again for user info we can do the same thing as above. (will increase code readability and decrease size).

A lot of unnecessary rendering is happening.

Styling:

- a. User form container background color not matching with outer container color.
- b. Buttons look really simple.
- c. The font size of p tags should be smaller than h2 tags. They both look to have the same size right now.

4) Userprofile.tsx:

For user info, it can be stored in array and using map property can be shown on screen.

Some code repeated many times.

Styling:

- a. Account details written two times.
- b. If no user profile image present then show some static image
- c. Button designs can be improved.
- d. Input label can be a little big.
- e. Payment info card background color not fitting the main container color.

5) allArtists.tsx:

Styling:

- a. First section with heading All Artists can have a wallpaper. Right now it looks empty.
- b. Artist card in coming soon section can be better in design.
- c. To add more information in artist card, so that chances of user clicking on card increases.
- d. Subscribe to waiting list can have fields in the center instead of right (Right now the left part really looks empty.)

6) Signup.tsx, Login.tsx, forgetPassword:

Left section is static, so we can create a component out of it.

Styling:

- a. Instead of white as a background color for right section, I think it should be dark, more related to the background color of left section.

7) Footer.tsx:

Styling:

- a. Text “terms and conditions” and “privacy policy” can be a little big. Right now it is hard to read it.
